

Exercise 2 – Interface Audit

In pairs, find one object or interface on campus to audit—anything you can physically handle or photograph. Spend the first ten minutes just handling or looking at it before writing anything down.

Then, working with your partner:

- work out what it actually lets you do (its real affordances)
- what tells you that, if anything (its signifiers)
- what confirms an action has been completed, if anything (its feedback)
- and whether the relationship between its controls and their effects makes sense (its mapping).

From there, identify specific merits or failures, stated precisely in this week's vocabulary—not "this is confusing," but something like "this door's flat plate has no signifier, so people default to pulling..."
