

Exercise 3 – Design Crimes

Norman's principles are useful because they give us a vocabulary for understanding why some interactions feel obvious, confusing, satisfying or frustrating. Today, we're going to deliberately break them.

In pairs, choose a familiar object or interface and redesign it to be as confusing and frustrating as possible. Create a quick prototype, sketch, or physical mock-up and demonstrate how it works.

Your design should commit at least three interaction crimes:

- Bad affordances / signifiers
- Confusing mapping
- No feedback
- Poor discoverability
- Unclear conceptual model
- Unnecessary constraints

Then...

Swap with another pair. They have to figure out what is wrong with it, without being told which principles you've broken.
